Flashless
Useless Coding

useless.github.com/flashless — *A WebKit plug-in to display preview images for Flash based video services and block the rest.*

Version 2.0.6

- Remove broken YOUTUBE video support.

- Fix problem with invalid XTUBE download URLs.

- Add support for TUMBLR videos and slideshows.

Further changes since 2.0

- Improved reliability when loading Flash. (Credit: ClickToFlash Developers)

- Fix a problem with YOUTUBE where users would see "Go Upgrade!" (Credit: ClickToFlash Developers)

- Play videos with QuickTime by default.

- Increased reliability of the BLIP.TV, FLICKR, TWITVID, and VIMEO services.

- Increased performance and various usability enhancements.

Installation

MAC OS X 10.5 "Leopard" or later required.

Quit SAFARI. Drag the icon labeled *Flashless.webplugin* from the disk image to the icon labeled *Internet Plug-Ins*. You can now relaunch SAFARI. Done.

Note: This will install FLASHLESS for all users. To install just for the current user, copy *Flashless.webplugin* to ~/Library/Internet Plug-Ins instead.

Usage

Flashless replaces all Flash elements on a site with an unobtrusive graphic. To show the original Flash object just click on the placeholder.

A preview image of the video is displayed for content from a supported video service. The name of the service is displayed in the lower right corner.

You can use these modifier keys:

Command	jump to original video site	*Shift*	play with Flash
Option	download the video	*Control*	show the menu

Not all features are available for all sites.
